

Zaki – Problem Brief

In the real estate and construction industries, many critical tasks are still performed manually, leading to delays, errors, and inefficiencies. Tasks like summarizing RFIs (Requests for Information), generating daily site reports, processing material orders, checking safety compliance, answering tenant questions, and compiling risk dashboards are repetitive and time-consuming.

The pain points are real and widespread:

1. Site engineers and architects waste valuable time reading long RFI documents, often leading to communication delays and misinterpretations.
2. Foremen and site managers struggle to submit detailed daily reports on time, resulting in missing or inaccurate site data.
3. Procurement teams often rely on outdated spreadsheets to forecast materials, causing over-ordering or delays in construction.
4. Safety officers cannot monitor PPE compliance at scale, leading to unsafe practices and potential legal issues.
5. Property managers are flooded with repetitive tenant emails, reducing their ability to focus on more urgent matters.
6. Project managers and directors spend hours gathering scattered data to create risk summaries for weekly meetings.

A “Zaki” solution

Zaki is designed to solve all these pain points through intelligent automation. It acts as a virtual team member working with various colleges from almost all departments, handling routine tasks with speed and accuracy. Each feature is directly linked to a specific workflow problem, providing relief to the professionals most affected.

Current Progress

Zaki is launched with two main features:

- 1- RFI Summarize: solves pain point [1].
- 2- Daily report generator from simple notes: solves pain point [2].

At this point Zaki may not be fully autonomous but indeed he has lightened the workload!

Next Steps and vision

Implementing the rest of the plugins to complete Zaki’s core functionality and deploying the existing features. From now on, Zaki is not just software. He is a faithful employee.

PS: Check `Zaki_AI.ipynb` in any jupyter notebook platform to know more about Zaki!
